

Following is based on adverse events reported to 3rd December.

57,624 adverse events were reported by 18-65 years olds.

39,736 of these (69%) were the types of reactions that would ground flight staff.

Assuming 16 million Australian population and 80% jabbed and 1% report rate 45% of the jabbed population has experienced an adverse reaction: 31% are things that would be a flight risk.

Now if the jab rate is lower than 80% (which I think it is) and reporting rate is lower than 1% (which I think it could be) then it is going to be even higher.

50% jab rate and 1% reported gives 72% with an adverse reaction - half (50%) of jabbed flight staff can't (shouldn't) fly.

80% jab rate and 0.5% reported gives 90% with with an adverse reaction.

50% jab rate and 0.5% reported is off the scale (144%).

Pretty terrifying stuff.

18-65 year olds

	Population vaccinated	TGA Report rate	90.0%	80.0%	50.0%	90.0%	80.0%	50.0%	80.0%	50.0%
